# EXTREMAL PROJECTORS IN THE SEMI-CLASSICAL CASE by Sophie CHEMLA 

## 1. Introduction.

Let $\mathfrak{g}$ be a complex semi-simple finite dimensional Lie algebra, $\mathfrak{h}$ a Cartan subalgebra of $\mathfrak{g}$ and $\Delta$ the root system associated to $\mathfrak{h}$. We will write $\Delta^{+}$(respectively $\Delta^{-}$) for the set of positive (respectively negative) roots of $\Delta$ and put $\rho=\frac{1}{2} \sum_{\gamma \in \Delta^{+}} \gamma$. We will denote by $B=\left(\alpha_{1}, \ldots, \alpha_{l}\right)$ the set of simple roots. Let $\mathfrak{g}_{\gamma}$ be the root space associated to the root $\gamma$. We put

$$
\mathfrak{n}=\underset{\gamma \in \Delta^{+}}{\oplus} \mathfrak{g}_{\gamma}, \quad \mathfrak{b}=\mathfrak{h} \oplus \mathfrak{n}, \mathfrak{n}_{-}=\underset{\gamma \in \Delta^{+}}{\oplus} \mathfrak{g}_{-\gamma}
$$

Let $R(\mathfrak{h})$ be the field of rational functions on $\mathfrak{h}^{*}$. One introduces the algebra $U^{\prime}(\mathfrak{g})=U(\mathfrak{g}) \underset{S(\mathfrak{h})}{\otimes} R(\mathfrak{h})$. Let us consider the generic Verma module $V=\frac{U^{\prime}(\mathfrak{g})}{U^{\prime}(\mathfrak{g}) \mathfrak{n}}$. Zhelobenko $([\mathrm{Z} 1])$ showed that $V^{\mathfrak{n}}=R(\mathfrak{h}) 1_{+}$(where $1_{+}=$ $\left.1+U^{\prime}(\mathfrak{g}) \mathfrak{n}\right)$. The decomposition $V=\mathfrak{n}^{-} V \oplus R(\mathfrak{h}) 1_{+}$defines a projector $p$ onto $R(\mathfrak{h}) 1_{+}$called the extremal projector. Inspired by a work of Asherova, Smirnov and Tolstoy ([AST]), Zhelobenko ([Z1]) showed that $p$ factorizes into elementary projectors. Let $\left(\gamma_{1}, \ldots, \gamma_{m}\right)$ be a normal ordering on the positive roots. Introduce the following notations:

$$
\begin{aligned}
& p_{\alpha}=\sum_{k=0}^{\infty} \frac{(-1)^{k}}{k!f_{\alpha, k}} e_{-\alpha}^{k} e_{\alpha}^{k} \\
& f_{\alpha, 0}=1, \\
& \text { if } k>0, f_{\alpha, k}=\left(h_{\alpha}+\rho\left(h_{\alpha}\right)+1\right) \ldots\left(h_{\alpha}+\rho\left(h_{\alpha}\right)+k\right)
\end{aligned}
$$

[^0]( $e_{\delta}$ being the root vector associated to the root $\delta$ and $h_{\delta}$ the coroot). We have $p=p_{\gamma_{1}} \ldots p_{\gamma_{m}}([\mathrm{Z} 1])$. Let $w=s_{1} \ldots s_{j}$ be a reduced decomposition of $w \in W$ (with $s_{k}=s_{\beta_{k}}, \beta_{k}$ a simple root ). Put $w_{i}=s_{1} \ldots s_{i}$. The roots $\gamma_{i}=w_{i-1}\left(\beta_{i}\right)\left(w_{0}=1\right)$ are pairwise distinct and
$$
\Delta_{w}=\left\{\alpha \in \Delta_{+} \mid w^{-1}(\alpha)<0\right\}=\left\{\gamma_{1}, \ldots, \gamma_{j}\right\}
$$

Put $\mathfrak{n}_{w}=\underset{\alpha \in \Delta_{w}}{\oplus} \mathfrak{g}_{\alpha}$. In [Z2], Zhelobenko gives an explicit description of $V^{\mathfrak{n}_{w}}$. We will establish similar results for the symmetric algebra (the so-called semi-classical case).

Let us consider the analytic manifold $(\mathfrak{g} / \mathfrak{n})^{*}$. We will endow it with the following coordinate system $\left(\left(e_{-\alpha}\right)_{\alpha \in \Delta_{+}},\left(h_{\alpha_{i}}\right)_{i \in[1, l]}\right)$. We will call $U_{\delta}$ the open subset of $(\mathfrak{g} / \mathfrak{n})^{*}$ defined by the equation $h_{\delta} \neq 0$. We define $\Phi_{\delta}$ to be the following rational map of $U_{\delta}$ :

$$
\forall \lambda \in U_{\delta}, \Phi_{\delta}(\lambda)=\exp \left(\frac{e_{-\delta}(\lambda)}{h_{\delta}(\lambda)} e_{\delta}\right) \cdot \lambda
$$

where the dot denotes natural action of $\mathfrak{n}$ on $(\mathfrak{g} / \mathfrak{n})^{*}$. By composition, $\Phi_{\delta}$ defines an algebra morphism of $\mathcal{A}\left(U_{\delta}\right)$ which we call $\pi_{\delta}$. We put

$$
U_{w}=U_{\gamma_{1}} \cap \ldots \cap U_{\gamma_{j}}
$$

We will denote by $\mathcal{P}\left(U_{w}\right)$ (respectively $\mathcal{A}\left(U_{w}\right)$ ) the set of regular functions (respectively analytic functions) on $U_{w}$ and we will write $\mathcal{P}\left(U_{w}\right)^{\mathrm{n}_{w}}$ (respectively $\mathcal{A}\left(U_{w}\right)^{\mathrm{n}_{w}}$ ) the set of invariant functions of $\mathcal{P}\left(U_{w}\right)$ (respectively $\left.\mathcal{A}\left(U_{w}\right)\right)$ under the action of $\mathfrak{n}_{w}$. We prove the following result:

Theorem. - The algebra morphism $\pi_{w}=\pi_{\gamma_{1}} \circ \ldots \circ \pi_{\gamma_{j}}$ does not depend on the reduced expression of $w$. It establishes an isomorphism between

$$
\mathcal{C}_{w}=\left\{f \in \mathcal{A}\left(U_{w}\right) \left\lvert\, \frac{\partial f}{\partial e_{-\gamma_{1}}}=\ldots=\frac{\partial f}{\partial e_{-\gamma_{j}}}=0\right.\right\}
$$

and $\mathcal{A}\left(U_{w}\right)^{\mathrm{n}_{w}}$. Moreover $\pi_{w}$ sends $\mathcal{C}_{w} \cap \mathcal{P}\left(U_{w}\right)$ onto $\mathcal{P}\left(U_{w}\right)^{\mathrm{n}_{w}}$.
Let $N_{w}$ be the connected simply connected group whose Lie algebra is $\mathfrak{n}_{w}$. The main ingredient of the proof will be the choice of a point in each $N_{w}$-orbit lying in $U_{w}$ in accordance with the following proposition:

Proposition. - Let $\lambda$ be in $U_{w}$. The point $\Phi_{\gamma_{j}} \Phi_{\gamma_{j-1}} \ldots \Phi_{\gamma_{1}}(\lambda)$ is the unique point of the orbit $N_{w} \cdot \lambda$ whose coordinates $e_{-\gamma_{1}}, \ldots, e_{-\gamma_{j}}$ vanish.

In the appendix, we shall give a factorization for the extremal projector of the Virasoro algebra in the semi-classical case. Note that the non commutative case is still open. It is very different from the semi-simple case because the Virasoro algebra does not admit any normal ordering.

Notations. - Along all this article $\mathfrak{g}$ will denote a complex semi-simple finite dimensional Lie algebra and $\mathfrak{h}, \Delta_{,} \Delta_{+}, \Delta_{-}, \mathfrak{n}, \mathfrak{n}_{-}$, $B=\left(\alpha_{1}, \ldots, \alpha_{l}\right)$ will be as above. Denote by $W$ the Weyl group associated to these choices and $\bar{w}$ its longest element. Let $\gamma$ be an element of $\Delta^{+}$and let $h_{\gamma}$ be the unique element of $\left[\mathfrak{g}_{\gamma}, \mathfrak{g}_{-\gamma}\right.$ ] such that $\gamma\left(h_{\gamma}\right)=2$. If $e_{\gamma}$ is in $\mathfrak{g}_{\gamma}$, then there exists a unique $e_{-\gamma}$ such that $\left(h_{\gamma}, e_{\gamma}, e_{-\gamma}\right)$ is a $\operatorname{sl}(2)$-triple. If $\alpha$ and $\beta$ are two roots, we set $\left[e_{\alpha}, e_{\beta}\right]=C_{\alpha, \beta} e_{\alpha+\beta}$ with the convention that $C_{\alpha, \beta}$ is zero if $\alpha+\beta$ is not a root.

The ordering $\left(\gamma_{1}, \ldots, \gamma_{m}\right)$ on the positive roots is normal if any composite root is located between its components. Thus for all positive roots $\gamma_{i}, \gamma_{j}, \gamma_{k}$, the equality $\gamma_{k}=\gamma_{i}+\gamma_{j}$ implies $i \leqslant k \leqslant j$ or $j \leqslant k \leqslant i$. There is a one to one correspondence between normal orderings and reduced expression of $\bar{w}$ ([Z2]). Let us recall it. Denote by $s_{i}$ the reflexion with respect to a simple root $\beta_{i}$. If $\bar{w}=s_{1} \ldots s_{m}$, then $\left(\beta_{1}, s_{1}\left(\beta_{2}\right), \ldots, s_{1} \ldots s_{i-1}\left(\beta_{i}\right), \ldots, s_{1} \ldots s_{m-1}\left(\beta_{m}\right)\right)$ are in normal ordering.

If $V$ is a vector space, $S(V)$ will be the symmetric algebra of $V$. Lastly, if $P$ is in $S(V), S(V)_{P}$ will be the localization of $S(V)$ with respect to $\left\{P^{n} \mid n \in \mathbb{N}\right\}$.

Acknowledgments. - I would like to thank M. Duflo for suggesting to me to study the semi-classical case and for helpful discussions. I am grateful to the referee for indicating to me that the main theorem could be proved in a geometric way.

## 2. Extremal equations in $(\mathfrak{g} / \mathfrak{n})^{*}$.

We consider $(\mathfrak{g} / \mathfrak{n})^{*}$ as an analytic manifold. We endow it with the following coordinate system $\left(\left(e_{-\alpha}\right)_{\alpha \in \Delta_{+}},\left(h_{\alpha_{i}}\right)_{i \in[1, l]}\right)$. If $\delta$ is a positive root, we will denote by $U_{\delta}$ the open subset of $(\mathfrak{g} / \mathfrak{n})^{*}$ defined by the equation $h_{\delta} \neq 0$. If $U$ is an open subset for the Zariski topology, we will write $\mathcal{A}(U)$ for the algebra of analytic functions on $U$ and $\mathcal{P}(U)$ for the algebra of regular functions on $U$. We will define $\Phi_{\delta}$ to be the following rational map
of $U_{\delta}$

$$
\forall \lambda \in U_{\delta}, \quad \Phi_{\delta}(\lambda)=\exp \left(\frac{e_{-\delta}(\lambda)}{h_{\delta}(\lambda)} e_{\delta}\right) \cdot \lambda
$$

By composition, $\Phi_{\delta}$ defines an algebra morphism of $\mathcal{A}\left(U_{\delta}\right)$ which we call $\pi_{\delta}$. We will denote by $X_{\delta}$ the natural action of $e_{\delta}$ on $\mathcal{A}\left(U_{\delta}\right)$. Remark that $X_{\delta}$ is a derivation. If $f$ is in $\mathcal{P}\left(U_{\delta}\right)$, we have

$$
(*) \quad \pi_{\delta}(f)=\sum_{k=0}^{\infty}(-1)^{k} \frac{e_{-\delta}^{k}}{k!h_{\delta}^{k}} X_{\delta}^{k} \cdot f
$$

where $e_{-\delta}$ denotes the multiplication by $e_{-\delta}$. The operator $\pi_{\delta}$ is the commutative analog of the Zhelobenko's elementary projector.

Let $w=s_{1} \ldots s_{j}$ be a reduced decomposition of $w \in W$ (with $\left.s_{k}=s_{\beta_{k}}, \beta_{k} \in B\right)$. Put $w_{i}=s_{1} \ldots s_{i}$. The roots $\gamma_{i}=w_{i-1}\left(\beta_{i}\right)\left(w_{0}=1\right)$ are pairwise distinct and

$$
\Delta_{w}=\left\{\alpha \in \Delta_{+} \mid w^{-1}(\alpha)<0\right\}=\left\{\gamma_{1}, \ldots, \gamma_{j}\right\}
$$

An ordering in $\Delta_{w}$ is called normal if it coincides with the initial segment of some normal ordering in $\Delta^{+}$(that is compatible with one of the reduced expression of $\bar{w})$. Note that $\left(\gamma_{1}, \ldots, \gamma_{j}\right)$ is a normal ordering of $\Delta_{w}$. Put

$$
U_{w}=\bigcap_{\delta \in \Delta_{w}} U_{\delta}
$$

We have

$$
\mathcal{P}\left(U_{w}\right)=\left(\frac{S(\mathfrak{g})}{S(\mathfrak{g}) \mathfrak{n}}\right)_{h_{\gamma_{1}} \ldots h_{\gamma_{j}}}=S\left(\frac{\mathfrak{g}}{\mathfrak{n}}\right)_{h_{\gamma_{1} \ldots h_{\gamma_{j}}}}
$$

We will denote by $N_{w}$ the connected and simply connected group whose Lie algebra is $\mathfrak{n}_{w}=\underset{\alpha \in \Delta_{w}}{\oplus} \mathfrak{g}_{\alpha}$. We will start by proving the following proposition.

Proposition 2.1. - Let $\lambda$ be in $U_{w}$. The point $\Phi_{\gamma_{j}} \Phi_{\gamma_{j-1}} \ldots \Phi_{\gamma_{1}}(\lambda)$ is the unique point of the orbit $N_{w} \cdot \lambda$ whose coordinates $e_{-\gamma_{1}}, \ldots, e_{-\gamma_{j}}$ vanish. In particular $\Phi_{\gamma_{j}} \Phi_{\gamma_{j-1}} \ldots \Phi_{\gamma_{1}}$ does not depend on the normal ordering on $\Delta_{w}$.

Proof of Proposition 2.1. - Complete $\left(\gamma_{1}, \ldots, \gamma_{j}\right)$ into a normal ordering on the positive roots $\left(\gamma_{1}, \ldots, \gamma_{m}\right) \cdot \mathfrak{g} / \mathfrak{n}$ is endowed with the ba-$\operatorname{sis}\left(e_{-\gamma_{1}}, \ldots, e_{-\gamma_{m}}, h_{\alpha_{1}}, \ldots, h_{\alpha_{l}}\right)$. Let $\left(e_{-\gamma_{1}}^{*}, \ldots, e_{-\gamma_{m}}^{*}, h_{\alpha_{1}}^{*}, \ldots, h_{\alpha_{l}}^{*}\right)$ be the dual basis. We will often identify the point $a_{\gamma_{1}} e_{-\gamma_{1}}^{*}+\ldots+a_{\gamma_{m}} e_{-\gamma_{m}}^{*}+b_{1} h_{\alpha_{1}}^{*}+$
$\ldots+b_{l} h_{\alpha_{l}}^{*}$ with its coordinates $\left(a_{\gamma_{1}}, \ldots, a_{\gamma_{m}}, b_{1}, \ldots, b_{l}\right)$. Let us see that there is a unique point in $N_{w} \cdot \lambda$ whose coordinates $e_{-\gamma_{1}}, \ldots, e_{-\gamma_{j}}$ vanish. Assume that there are two such points $f=\left(0, \ldots, 0, a_{\gamma_{j+1}}, \ldots, a_{\gamma_{m}}, b_{1}, \ldots, b_{l}\right)$ and $f^{\prime}=\left(0, \ldots, 0, a_{\gamma_{j+1}}^{\prime}, \ldots, a_{\gamma_{m}}^{\prime}, b_{1}^{\prime}, \ldots, b_{l}^{\prime}\right)$. Then there exist complex numbers $\left(t_{1}, \ldots, t_{j}\right)$ such that $\exp \left(t_{1} e_{\gamma_{1}}+\ldots+t_{j} e_{\gamma_{j}}\right) \cdot f=f^{\prime}$. One can show easily the following equalities:

$$
\begin{aligned}
& e_{\gamma_{l}} \cdot e_{-\gamma_{k}}^{*}=-C_{\gamma_{l},-\gamma_{k}} e_{-\gamma_{l}-\gamma_{k}}^{*} \\
& e_{\gamma_{l}} \cdot h_{-\alpha_{i}}^{*}=-h_{-\alpha_{i}}^{*}\left(h_{\gamma_{l}}\right) e_{-\gamma_{l}}^{*} .
\end{aligned}
$$

From these equalities, one deduces easily that the term in $e_{-\gamma_{1}}^{*}$ of $\exp \left(t_{1} e_{\gamma_{1}}+\ldots+t_{j} e_{\gamma_{j}}\right) \cdot\left(0, \ldots, 0, a_{\gamma_{j+1}}, \ldots, a_{\gamma_{m}}, b_{1}, \ldots, b_{l}\right)$ is $-t_{1} f\left(h_{\gamma_{1}}\right)$. As $f$ is in $U_{w}$, we get $t_{1}=0$. We reproduce the same reasoning to show that $t_{2}, t_{3}, \ldots, t_{j}$ are zero. So that we have proved that the two points $f$ and $f^{\prime}$ coincide. It is not difficult to deduce from the normal ordering property that $\Phi_{\gamma_{i}}$ sends the point $\left(x_{\gamma_{1}}, \ldots, x_{\gamma_{m}}, y_{1}, \ldots, y_{l}\right)$ to a point $\left(x_{\gamma_{1}}^{\prime}, \ldots, x_{\gamma_{i-1}}^{\prime}, 0, x_{\gamma_{i+1}}^{\prime}, \ldots, x_{\gamma_{m}}^{\prime}, y_{1}, \ldots, y_{l}\right)$ and that it sends the point $\left(0, \ldots, 0, x_{\gamma_{i}}, \ldots, x_{\gamma_{m}}, y_{1}, \ldots, y_{l}\right)$ to a point $\left(0, \ldots, 0, x_{\gamma_{i+1}}^{\prime}, \ldots, x_{\gamma_{m}}^{\prime}\right.$, $\left.y_{1}, \ldots, y_{l}\right)$. So that $\Phi_{\gamma_{j}} \Phi_{\gamma_{j-1}} \ldots \Phi_{\gamma_{1}}(\lambda)$ is the unique point of $N_{w} \cdot \lambda$ whose coordinates $e_{-\gamma_{1}}, \ldots, e_{-\gamma_{j}}$ vanish. This finishes the proof of Proposition 2.1.

As a consequence of the previous proposition, we may write $\Phi_{w}$ for the operator $\Phi_{\gamma_{j}} \Phi_{\gamma_{j-1}} \ldots \Phi_{\gamma_{1}}$. The algebra homomorphism defined by $\Phi_{w}$ on $\mathcal{A}\left(U_{w}\right)$ will be denoted by $\pi_{w}$. Using Proposition 2.1, we will give a geometric proof of the following result.

Theorem 2.2. - 1) If $\overline{\mathfrak{n}}_{w}$ denotes the linear hull of $\left(e_{-\alpha}\right)_{\alpha \in \Delta_{w}}$, one has $\operatorname{Ker} \pi_{w}=\overline{\mathfrak{n}}_{w} \mathcal{A}\left(U_{w}\right)$.
2) The operator $\pi_{w}$ is the projector onto $\mathcal{A}\left(U_{w}\right)^{\mathbf{n}_{w}}$ with kernel $\overline{\mathfrak{n}}_{w} \mathcal{A}\left(U_{w}\right)$ and its restriction to $\mathcal{P}\left(U_{w}\right)$ is the projector onto $\mathcal{P}\left(U_{w}\right)^{\mathfrak{n}_{w}}$ with kernel $\overline{\mathfrak{n}}_{w} \mathcal{P}\left(U_{w}\right)$.
3) The operator $\pi_{w}$ establishes an isomorphism $\Pi_{w}$ between

$$
\mathcal{C}_{w}=\left\{f \in \mathcal{A}\left(U_{w}\right) \left\lvert\, \frac{\partial f}{\partial e_{-\gamma_{1}}}=\ldots \frac{\partial f}{\partial e_{-\gamma_{j}}}=0\right.\right\}
$$

and $\mathcal{A}\left(U_{w}\right)^{\mathfrak{n}_{w}}$. Moreover $\Pi_{w}$ sends $\mathcal{C}_{w} \cap \mathcal{P}\left(U_{w}\right)$ onto $\mathcal{P}\left(U_{w}\right)^{\mathfrak{n}_{w}}$. If $f$ is in $\mathcal{A}\left(U_{w}\right)^{\mathfrak{n}_{w}}, \Pi_{w}^{-1}(f)$ is the restriction of $f$ to the subvariety of equations $e_{-\gamma_{1}}=\ldots=e_{-\gamma_{j}}=0$.

Proof of Theorem 2.2. - From the previous proposition, the inclusion $\overline{\mathfrak{n}}_{w} \mathcal{A}\left(U_{w}\right) \subset \operatorname{Ker} \pi_{w}$ is clear. Moreover, a standard reasoning shows that

$$
\mathcal{A}\left(U_{w}\right)=\mathcal{C}_{w} \oplus \overline{\mathfrak{n}}_{w} \mathcal{A}\left(U_{w}\right)
$$

Then one sees easily that $\operatorname{Ker} \pi_{w} \cap \mathcal{C}_{w}=\{0\}$. So that we have $\overline{\mathfrak{n}}_{w} \mathcal{A}\left(U_{w}\right)=$ $\operatorname{Ker} \pi_{w}$.

Let us now show that $\operatorname{Im} \pi_{w}=\mathcal{A}\left(U_{w}\right)^{\mathfrak{n}_{w}}$ and that $\pi_{w}$ is a projector. Let $\alpha$ be in $\Delta_{w}$. For any $f$ in $\mathcal{A}\left(U_{w}\right)$ and any $\lambda$ in $U_{w}$, we have

$$
\left(X_{\alpha} \circ \pi_{w}\right)(f)(\lambda)=\frac{d}{d t} f\left(\Phi_{\gamma_{j}} \ldots \Phi_{\gamma_{1}} \exp \left(-t e_{\alpha}\right) \lambda\right)_{\mid t=0}
$$

But for any $t, \Phi_{\gamma_{j}} \ldots \Phi_{\gamma_{1}} \exp \left(-t e_{\alpha}\right) \lambda$ is the unique point of $N_{w} \cdot \lambda$ whose coordinates $e_{-\gamma_{1}}, \ldots, e_{-\gamma_{j}}$ vanish. So that $X_{\alpha} \circ \pi_{w}=0$. We have thus proved the inclusion $\operatorname{Im} \pi_{w} \subset \mathcal{A}\left(U_{w}\right)^{n_{w}}$. Now it is clear that $\pi_{w}$ is a projector : check that $\pi_{w} \circ \pi_{w}=\pi_{w}$ on coordinates using the formula (*). The reverse inclusion $\mathcal{A}\left(U_{w}\right)^{\mathbf{n}_{w}} \subset \operatorname{Im} \pi_{w}$ will be a consequence of the following lemma.

Lemma 2.3. - Let $k$ be in $[1, j]$ and let $f$ be in $\mathcal{A}\left(U_{w}\right)$. If $X_{\gamma_{k}} f=0$, then $\pi_{\gamma_{k}} f=f$.

Proof of Lemma 2.3. - We first remark that $\left(\pi_{\gamma_{k}}\left(e_{-\gamma_{1}}\right), \ldots\right.$, $\left.\pi_{\gamma_{k}}\left(e_{-\gamma_{k-1}}\right), e_{-\gamma_{k}}, \pi_{\gamma_{k}}\left(e_{-\gamma_{k+1}}\right), \ldots, \pi_{\gamma_{k}}\left(e_{-\gamma_{m}}\right), h_{\alpha_{1}}, \ldots, h_{\alpha_{l}}\right)$ is a coordinate system in $U_{w}$. Indeed, one may see by induction that for any $i \leqslant k-1$ (respectively $i \geqslant k+1$ ), $e_{-\gamma_{i}}$ may be expressed as a regular function of $\left(\pi_{\gamma_{k}}\left(e_{-\gamma_{1}}\right), \ldots, \pi_{\gamma_{k}}\left(e_{-\gamma_{i}}\right), h_{\alpha_{1}}, \ldots, h_{\alpha_{l}}\right)$ (respectively $\left.\left(\pi_{\gamma_{k}}\left(e_{-\gamma_{i}}\right), \ldots, \pi_{\gamma_{k}}\left(e_{-\gamma_{m}}\right), h_{\alpha_{1}}, \ldots, h_{\alpha_{l}}\right)\right)$. We put $\left(\epsilon_{1}, \ldots, \epsilon_{m+l}\right)=$ $\left(\pi_{\gamma_{k}}\left(e_{-\gamma_{1}}\right), \ldots, \pi_{\gamma_{k}}\left(e_{-\gamma_{k-1}}\right), e_{-\gamma_{k}}, \pi_{\gamma_{k}}\left(e_{-\gamma_{k+1}}\right), \ldots, \pi_{\gamma_{k}}\left(e_{-\gamma_{m}}\right), h_{\alpha_{1}}, \ldots, h_{\alpha_{l}}\right)$. In these coordinates, we have $X_{\gamma_{k}}=h_{\gamma_{k}} \frac{\partial}{\partial \epsilon_{k}}$. So that if $X_{\gamma_{k}} f=0$, then $f$ does not depend on $\epsilon_{k}$ and it becomes clear that there exists $g$ such that $f=\pi_{\gamma_{k}} g$. As $\pi_{\gamma_{k}}$ is a projector, we have $\pi_{\gamma_{k}} f=\pi_{\gamma_{k}} \pi_{\gamma_{k}} g=\pi_{\gamma_{k}} g$, which finishes the proof of the lemma.

It is clear from the proof that $\pi_{w}$ sends $\mathcal{C}_{w} \cap \mathcal{P}\left(U_{w}\right)$ onto $\mathcal{P}\left(U_{w}\right)^{\mathrm{n}_{w}}$.
In particular $\pi_{\bar{w} \mid \mathcal{P}\left(U_{\bar{w}}\right)}$ is the projector onto $S(\mathfrak{h})_{h_{\gamma_{1}} \ldots h_{\gamma_{m}}}$ with kernel $\mathfrak{n}_{-} \mathcal{P}\left(U_{\bar{w}}\right)$. By analogy to Asherova, Tolstoy, Smirnov and Zhelobenko's work, we will call it the extremal projector.

Proposition 2.1 gives a geometric interpretation of the projector $\pi_{w}$.

## 3. Appendix: Extremal projector for the Virasoro algebra in the semi-classical case.

In this section, we shall give a factorization of the Virasoro algebra extremal projector in the semi-classical case. Note that the non commutative case is still open. It is very different from the semi-simple case because the Virasoro algebra does not admit any normal ordering. Recall that the Virasoro algebra Vir is the infinite dimensional Lie algebra generated by $\left\{e_{i} \mid i \in \mathbb{Z}\right\} \cup\{c\}$ with commutation rules

$$
\left[e_{i}, e_{j}\right]=(j-i) e_{i+j}+\frac{\left(j^{3}-j\right)}{12} \delta_{i+j, 0} c, \quad\left[e_{i}, c\right]=0
$$

Vir admits the following triangular decomposition:

$$
\operatorname{Vir}=\operatorname{Vir}_{+} \oplus \operatorname{Vir}_{0} \oplus \operatorname{Vir}_{-}
$$

where

$$
\operatorname{Vir}_{+}=\underset{i \geqslant 1}{\oplus} \mathbb{C} e_{i}, \text { Vir }_{0}=\mathbb{C} e_{0} \oplus \mathbb{C} c, \text { Vir }_{-}=\underset{i \leqslant-1}{\oplus} \mathbb{C} e_{i}
$$

We will also use the notation

$$
\operatorname{Vir}_{r,+}=\underset{i \geqslant r}{\oplus} \mathbb{C} e_{i} \text { and } \operatorname{Vir}_{r,-}=\underset{i \leqslant-r}{\oplus} \mathbb{C} e_{i} .
$$

$\operatorname{Vir}_{r,+}$ and $\operatorname{Vir}_{r,-}$ are Lie subalgebras of Vir.
Let $R\left(\mathrm{Vir}_{0}\right)$ be the field of fractions of $S\left(\mathrm{Vir}_{0}\right)$. We introduce the algebra

$$
S^{\prime}(\text { Vir })=S(\text { Vir }) \underset{S\left(\text { Vir }_{0}\right)}{\otimes} R\left(\text { Vir }_{0}\right)=S^{\prime}\left(\text { Vir } / \text { Vir }_{-}\right)
$$

There is a natural action of Vir_ on $S^{\prime}$ (Vir/Vir_). Through this action, for any negative $i, e_{i}$ defines a derivation $X_{i}$ of $S^{\prime}\left(\frac{\text { Vir }}{\text { Vir }_{-}}\right)$. Set

$$
T_{r}=\left(\frac{S^{\prime}\left(\text { Vir }^{\prime}\right)}{S^{\prime}\left(\text { Vir }^{2 i r} \text { Vir }_{-}\right.}\right)^{\operatorname{Vir}_{r,-}}
$$

The result and the proof of the following lemma is left to the reader.

Lemma 3.1.

$$
T_{r}=\underset{k_{1}, \ldots, k_{r-1} \in \mathbb{N}}{\oplus} R\left(\operatorname{Vir}_{0}\right) e_{1}^{k_{1}} \ldots e_{r-1}^{k_{r-1}}
$$

As a consequence of Lemma 3.1, we have the following decomposition:

$$
S^{\prime}\left(\text { Vir } / \operatorname{Vir}_{-}\right)=T_{r} \oplus \operatorname{Vir}_{r,+} S^{\prime}\left(\text { Vir } / \operatorname{Vir}_{-}\right)
$$

The proof of the next lemma is an easy computation.

Lemma 3.2. - For any $i>1$, the operator

$$
\pi_{i}=\sum_{k=0}^{\infty} \frac{(-1)^{k}}{k!\left(2 i e_{0}+\frac{\left(i^{3}-i\right) c}{12}\right)^{k}} e_{i}^{k} X_{-i}^{k}
$$

is an algebra morphism and satisfies the relations

$$
X_{-i} \circ \pi_{i}=0 \text { and } \pi_{i} \circ e_{i}=0
$$

(where $e_{i}$ denotes multiplication by $e_{i}$ ).
It is not hard to see that the operator $\Pi_{r}=\prod_{i=r}^{\infty} \pi_{i}$ is well defined.
Actually $\prod_{i=r}^{\infty} \pi_{i}\left(e_{1}^{a_{1}} \ldots e_{k}^{a_{k}}\right)=\prod_{r \leqslant i \leqslant k} \pi_{i}\left(e_{1}^{a_{1}} \ldots e_{k}^{a_{k}}\right)=0$ (by Lemma 3.2).

Theorem 3.3. - The operator $\Pi_{r}$ satisfies the relations

$$
\forall i \geqslant r, X_{-i} \circ \Pi_{k}=0, \Pi_{k} \circ e_{i}=0 .
$$

It is the projector onto $T_{r}$ with kernel $\operatorname{Vir}_{r,+} S^{\prime}\left(\frac{\text { Vir }}{\text { Vir }_{-}}\right)$.
In particular, $\Pi_{1}$ is the extremal projector.
Proof of Theorem 3.3. - The relations of the theorem are easy to check and they prove that $\Pi_{r}$ is a projector. To prove that the kernel of $\Pi_{r}$ is $\operatorname{Vir}_{r,+}$, we proceed as in the semi-simple case. The inclusion $\operatorname{Im} \Pi_{r} \subset T_{r}$ is a consequence of the theorem. To prove the reverse inclusion, remark that if $x$ is in $T_{r}$, then $\Pi_{r} x=x$, so that $x$ is in $\operatorname{Im} \Pi_{r}$.
